

Lecture Summary

, okay , so , today we are , discussing about climate change.

, many people , think its , just about the , weather getting hot , but , its much more , serious.

Climate change , means , longterm shifts in , temperature and weather , patterns.

This , happens , mainly due to , human activities , , burning fossil fuels , cutting trees , and pollution.

These , activities , release , greenhouse gases , carbon dioxide and , methane , which , trap heat.

Now , you see , greenhouse effect , is , natural and , needed for , life.

Without , it , the Earth , would be , too cold to , live.

But , the problem , now is , we , are increasing , these gases too , much.

, so , more heat , is getting trapped , making the planet , hotter.

This , is called , global warming.

And , because , of this , we , see , changes , ice caps , melting , sea , levels rising , and , more extreme weather.

, , have you , noticed , more , floods , heatwaves , wildfires , and , storms , happening , nowadays.

The , rising temperature , makes , oceans , warmer , which , leads to , stronger hurricanes and , more droughts.

, also , droughts , are , getting , worse , in some , places.

, one big , problem , is that , climate change , does nt , affect , everyone , equally.

, poor , countries , suffer , more because , they , do nt , have , the resources , to , handle , disasters.

, , small islands , they , are , going under , water , because , of sea , level rise.

, farmers , also , struggle , because , the , weather , is , changing , too fast.

But , we , can , slow , this , problem.

, we , need , to , reduce , carbon , emissions by , using , clean , energy , , solar and , wind.

, planting , more , trees , also , helps , because , trees , absorb , carbon , dioxide.

And , even , small , actions , , using , less , plastic , or , saving , electricity , can , make , a , difference.
